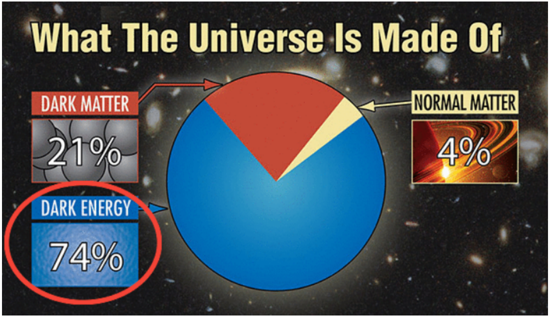
Dark Energy



- Part I: direct detection of DE on Earth
- Part II: consistency tests of ΛCDM, implications for (early and late) DE
- Part III: new ways to search for light particles (related or not to DE?)

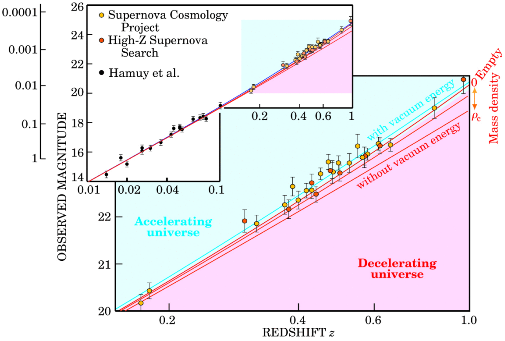
Note: blue → (Master's/PhD) students, red → postdocs

Student's name (student's institution)

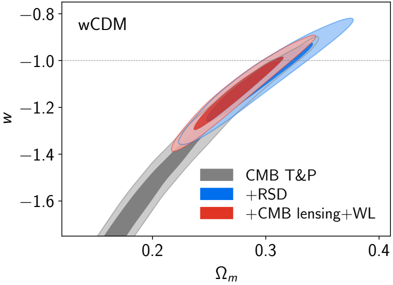
Postdoc's name (postdoc's institution)

The beaten track

Gravitational signatures of DE: the effect of DE's energy density on the background expansion or the growth of structure, probed by standard cosmological observations, with particular focus on DE's equation of state $w_{\mathrm{DE}} = P_{\mathrm{DE}}/\rho_{\mathrm{DE}}$ $(\sim -1?)$



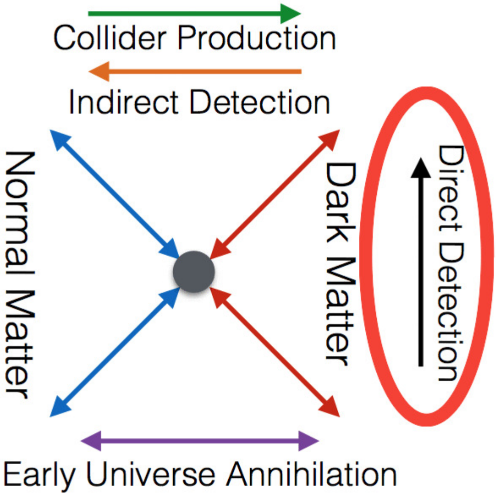
Credits: Perlmutter, Physics Today 56 (2003) 53



eBOSS collaboration, PRD 103 (2021) 083533

Part I:
direct detection of dark energy

Are gravitational signatures all there is?



What about dark energy?

Can dark energy and visible matter talk to each other?

Quintessence and the Rest of the World: Suppressing Long-Range Interactions

Sean M. Carroll
Phys. Rev. Lett. **81**, 3067 – Published 12 October 1998

If DE due to a new particle, this typically will:

- be very light [$m \sim H_0 \sim \mathcal{O}(10^{-33})\,\mathrm{eV}$]
- have gravitational-strength coupling to matter

Result/immediate obstacle: long-range fifth forces!

$$F_5 \sim -\frac{1}{M_5^2}\frac{m_1 m_2}{r^2}e^{-r/\lambda_5}\,, \quad M_5 \sim M_{\mathrm{Pl}}\,, \quad \lambda_5 \sim m^{-1} \sim H_0^{-1}$$

Screening

How to satisfy fifth-force tests?

- Tune the coupling to be extremely weak $[M \gg M_{\rm Pl}]$
- Tune the range to be extremely short $[\lambda \ll \mathcal{O}(\rm mm)]$
- Tune the dynamics so the force weakens based on its environment $\longrightarrow$ **screening**!

(At least) 3 ways to screen

$$F_5 \sim -\frac{1}{M_5^2(x)} \frac{m_1 m_2}{r^{2-n(x)}} e^{-r/\lambda_5(x)}$$

- $\lambda_5(x) \to$ **chameleon** screening (short range in dense environments)
- $M_5(x) \to$ symmetron screening (weak coupling in dense environments)
- $n(x) \to$ Vainshtein (force drops faster than $1/r^2$ around objects)

Chameleon screening

Fifth force range $\lambda(x)$ becomes short in dense environments, scalar field minimizes effective potential determined by coupling to matter

$$
\begin{aligned}
V_{\rm eff} &= V(\phi) + \phi\rho_m/M \\
m^2_{\rm eff} &= \frac{d^2 V_{\rm eff}}{d\phi^2}\Big|_{\phi=\phi_{\rm min}} \propto \rho^n\,,\, n>0 \\
\lambda &\sim 1/m_{\rm eff} \propto \rho^{-n/2}
\end{aligned}
$$

Baryon profiles most promising observable to probe DE-baryon scattering

Recap

Direct detection of dark energy

- Potentially lots of unharvested potential for direct detection of dark energy in dark matter direct detection experiments
- Room for large dark energy-baryons interactions in cosmology...
- ...possibly tightly constrained by (non-linear) LSS clustering and other astrophysical observations!

Where else might we learn something about dark energy (at early and late times)?

Perhaps from the Hubble tension!

Part II:
consistency tests of ΛCDM and implications for (early and late) DE

Viewing the Hubble tension ocean with different eyeglasses

(Received 15 June 2021; accepted 22 July 2021; published 15 September 2021)

No clear sign of early-time new physics in CMB data alone

↓

Why does ΛCDM fit CMB data so well?

↓

(Early-time) Consistency tests of ΛCDM

The early ISW (eISW) effect

Around recombination: Universe not fully matter dominated $\implies$ residual decay of gravitational potentials $\implies$ eISW effect sources anisotropies

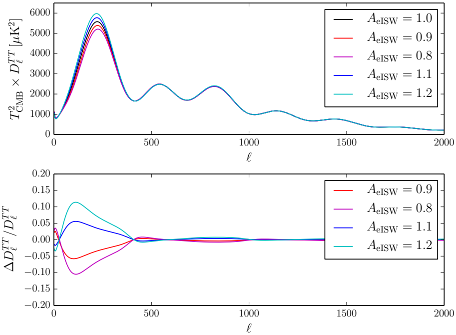
$$\Theta = \int_0^{\eta_0} d\eta \left[\underbrace{\propto g(\Theta_0 + \Psi)}_{\text{Sachs-Wolfe}} + \underbrace{\propto g v_b \frac{d}{d\eta}}_{\text{Doppler}} + \underbrace{\propto e^{-\tau}(\dot{\Psi} - \dot{\Phi})}_{\text{ISW}} + \underbrace{\propto (g\Pi + [g\ddot{\Pi}])}_{\text{Polarization}} \right] j_\ell(k\Delta\eta)$$

$$\Theta_\ell^{\text{ISW}}(k) = \underbrace{\int_0^{\eta_m} d\eta\, e^{-\tau} \left(\dot{\Psi} - \dot{\Phi}\right) j_\ell(k\Delta\eta)}_{\text{early ISW}} + \underbrace{\int_{\eta_m}^{\eta_0} d\eta\, e^{-\tau} \left(\dot{\Psi} - \dot{\Phi}\right) j_\ell(k\Delta\eta)}_{\text{late ISW}}$$

(A substantial amount of) New physics increasing $H(z)$ around $z_{\rm eq}/z_\star$ *should* leave an imprint on the eISW effect!

eISW consistency test

$$\Theta_\ell^{\mathrm{eISW}}(k) = A_{\mathrm{eISW}} \int_0^{\eta_m} d\eta\, e^{-\tau} \left(\dot{\Psi} - \dot{\Phi}\right) j_\ell(k\Delta\eta)$$

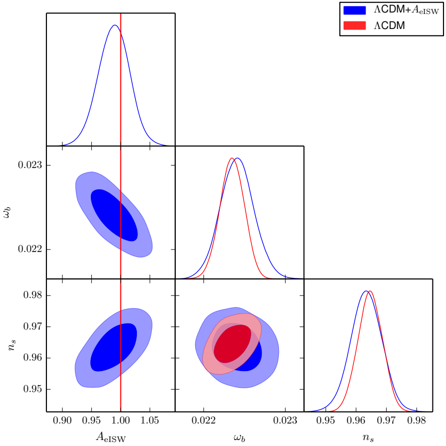


SV, PRD 104 (2021) 063524

Consistency check: within ΛCDM, data consistent with $A_{\mathrm{eISW}} = 1$?

eISW consistency test

Is the data consistent with $A_{\rm eISW} = 1$? (7-parameter ΛCDM+$A_{\rm eISW}$)



SV, PRD 104 (2021) 063524

Yes!

Parameter	*Planck* ΛCDM	*Planck* ΛCDM+$A_{\rm eISW}$
$100\omega_b$	2.235 ± 0.015	2.241 ± 0.020
ω_c	0.1202 ± 0.0013	0.1203 ± 0.0014

Implications for early-time new physics: EDE case study

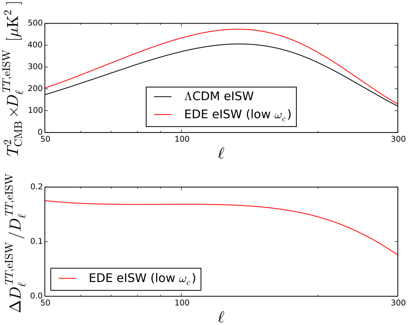
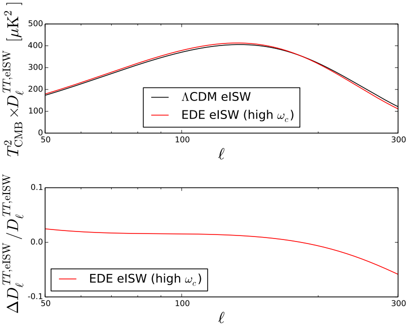
Let's extract only the eISW contribution to temperature anisotropies...

Low ω_c



High ω_c



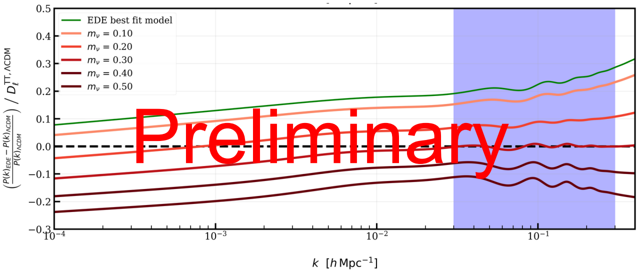
Almost 20% eISW excess!

No more than $\lesssim$ 3-5% eISW excess

Generic to models increasing pre-recombination $H(z)$, not just EDE

Early dark energy problems

Example: neutrino mass (nominally need $M_\nu \sim 0.3\,\mathrm{eV}$ to rescue EDE!)



Reeves, SV, Sherwin, Efstathiou, in preparation. Plot credits: Alex Reeves

Other possible ingredients: decaying DM, DM-dark radiation interactions

Alex Reeves (ETH Zürich)

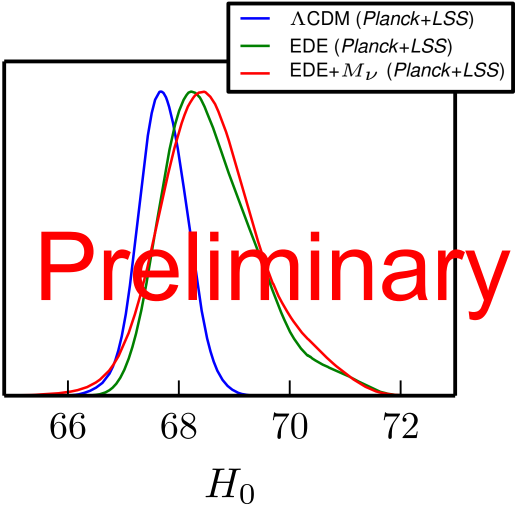
Blake Sherwin (Cambridge)

George Efstathiou (Cambridge)

Early dark energy problems

Massive neutrinos actually turn out not to work:

- Increase in S_8 (worsens S_8 discrepancy)
- M_ν negatively correlated with H_0 for CMB
- Need $M_\nu \sim 0.3\,\mathrm{eV}$, very hard to accommodate in LSS data
- Worsen fit to BAO data
- Maybe EDE not such a bad fit after all (prior volume effects)?



Reeves, SV, Sherwin, Efstathiou, in preparation. Plot credits: Alex Reeves

S_8 discrepancy – something to get excited about?

What can OAO do for cosmology in the 2020s?

Cosmology with old astrophysical objects

Can the ages of the oldest inhabitants of the Universe teach us something about the Universe's contents (including DE) and the Hubble tension?

Implications for the Hubble tension from the ages of the oldest astrophysical objects

Sunny Vagnozzi,[1,*] Fabio Pacucci,[2,3,†] and Abraham Loeb[2,3,‡]

[1]*Kavli Institute for Cosmology (KICC) and Institute of Astronomy, University of Cambridge, Madingley Road, Cambridge CB3 0HA, United Kingdom*
[2]*Center for Astrophysics | Harvard & Smithsonian, Cambridge, MA 02138, USA*
[3]*Black Hole Initiative, Harvard University, Cambridge, MA 02138, USA*

Potentially yes!

Fabio Pacucci (Harvard)

Avi Loeb (Harvard)

Cosmology with old astrophysical objects

$$t_U(z) = \int_z^{\infty} \frac{dz'}{(1+z')H(z')} \propto \frac{1}{H_0}$$

Pros and cons:

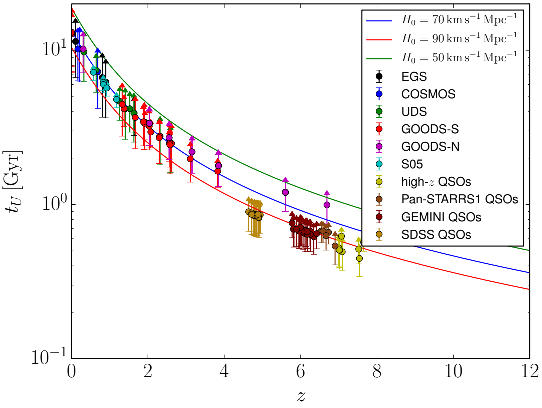
- OAO cannot be older than the Universe $\rightarrow$ **upper limit on** H_0
- $t_U(z)$ integral insensitive to early-time cosmology
- $\implies$ **late-time consistency test for ΛCDM independent of the early-time expansion**!
- Ages of astrophysical objects at $z > 0$ hard to estimate robustly ⚠

Usefulness in relation to the Hubble tension:

- Contradiction between OAO upper limit on H_0 and local H_0 measurements could indicate the need for non-standard late-time ($z \lesssim 10$) physics, or non-standard local physics
- Conclusions completely independent of pre-recombination physics

OAO age-redshift diagram

Age-redshift diagram up to $z \sim 8$

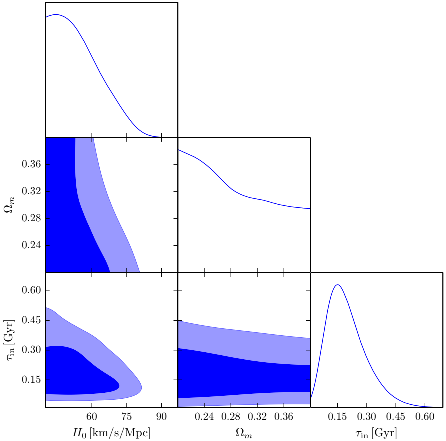


SV *et al.*, arXiv:2105.10421 (submitted to PRL)

Results

Assume ΛCDM at late times, constrain H_0, Ω_m, and incubation time $\tau_{\rm in}$

Prior for $\tau_{\rm in}$ following Jiménez *et al.*, JCAP 1903 (2019) 043; Valcin *et al.*, JCAP 2012 (2020) 022



SV *et al.*, arXiv:2105.10421 (submitted to PRL)

$H_0 < 73.2$km/s/Mpc (95% C.L.)

Implications for the Hubble tension

CAVEAT – if the OAO ages are reliable, possible explanations include:

- #1: ΛCDM may not be the end of the story at $z \lesssim 10$
- #2: Nothing wrong with ΛCDM at $z \lesssim 10$, need local new physics...

  Examples: screened 5th forces (Desmond *et al.*, PRD 100 (2019) 043537; Desmond & Sakstein, PRD 102 (2020) 023007), breakdown of FLRW (Krishnan *et al.*, CQG 38 (2021) 184001; arXiv:2106.02532),++
- #3: Just a boring 2σ fluke or systematics?

Is this a hint that pre-recombination new physics alone is not enough to solve the Hubble tension? Krishnan *et al.*, PRD 102 (2020) 103525; Jedamzik *et al.*, Commun. Phys. 4 (2021) 123; Haridasu *et al.*, PRD 103 (2021) 063539; Lin *et al.*, ApJ 920 (2021) 159; Dainotti *et al.*, ApJ 912 (2021) 150

Recap

Early-time consistency tests of ΛCDM

- eISW effect sets tight constraints on new pre-recombination physics
- Models which raise pre-recombination $H(z)$ will typically overpredict amplitude of eISW effect
- Example: early dark energy (need additional post-recombination new physics to solve "S_8 tension"?)
- Early-time new physics alone not enough to solve the Hubble tension?

Late-time consistency tests of ΛCDM

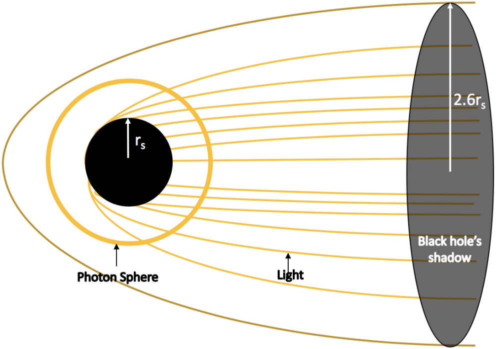
- Ages of old astrophysical objects can set upper limit on H_0
- Late-time consistency test of ΛCDM completely independent of pre-recombination assumptions
- Need new physics at $z \lesssim 10$ or on local scales?

Part III:
new searches for light particles
(dark energy-related or not)

Black hole shadows

For Schwarzschild BH shadow radius $3\sqrt{3}M$

Credits: Event Horizon Telescope collaboration



For advection-dominated hot (geometrically thick optically thin) accretion flow, edge of BH shadow robust to accretion flow details, only influenced by space-time geometry Narayan *et al.*, ApJ Lett. 885 (2019) L33; Bronzwaer & Falcke, arXiv:2108.03966

$\Longrightarrow$ we can use BH shadows to test fundamental physics!

Testing fundamental physics from black hole shadows?

Known information for M87*:

- Diameter of shadow δ, distance to mass ratio D/M $\rightarrow d = D\delta/M \sim 11.0 \pm 1.5$
- Deviation from circularity $\Delta C \lesssim 10\%$
- Axis ratio $\Delta y/\Delta x \lesssim 4/3$
- $\epsilon \equiv \Delta Q/Q_{\mathrm{Kerr}} \lesssim 4$, $Q_{\mathrm{Kerr}} = Ma^2$

Recipe: compute d and ΔC for BHs in your favourite theory, then impose these constraints

Roy, SV, Visinelli, arXiv:2112.06932 (submitted to PRD)

- Consistent modelling of superradiant instability in the presence of gas accretion and GW emission
- Evolution in size of SgrA* shadow $\Delta\theta \sim \mathcal{O}(1)\mu\text{as}$ due to superradiance potentially observable on human timescales $[\mathcal{O}(10)\,\text{yr}]$

Rittick Roy (Fudan)

Luca Visinelli (Shanghai)

Precession of planetary objects and new light particles

Asteroid astrometry as a fifth-force and ultralight dark sector probe

Yukawa potential from new light particle, e.g. new scalar or vector mediator from gauged $U(1)'$ sector [$U(1)_B$, $U(1)_{B-L}$, $L_\mu - L_{e,\tau}$,...]:

$$V(r) = \tilde{\alpha}\frac{GM_\odot M_*}{r}\exp\left[-\frac{r}{\lambda}\right] \to \frac{g^2}{4\pi}\frac{Q_\odot Q_*}{r}\exp\left[-\frac{mc^2}{\hbar c}r\right] \,,$$

Several GR calculations later, in the light mediator limit ($m \ll \hbar/ac$)...

$$|\Delta\varphi| \simeq \frac{2\pi}{1+\frac{g^2}{4\pi G m_p^2}}\frac{g^2}{4\pi G m_p^2}\left(\frac{amc}{\hbar}\right)^2(1-\mathrm{e})$$

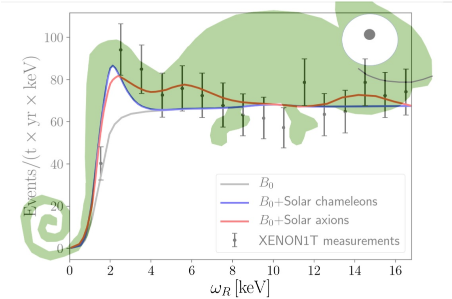
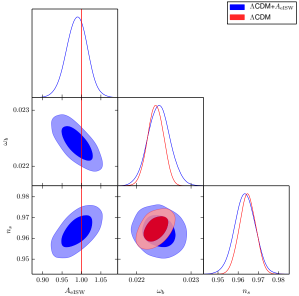
Conclusions

Direct detection of dark energy: lots of unharvested potential in dark matter direct detection experiments



SV *et al.*, PRD 104 (2021) 063023

Consistency tests of ΛCDM: pre-recombination new physics tightly constrained by eISW effect



SV, PRD 104 (2021) 063524

Much to be learned about dark energy beyond "standard" cosmological searches for its gravitational interactions
